

ABSTRACT

[0070] The present invention concerns a liquid crystal display device including: a

- 5 substrate; a plurality of thin film transistors each including a gate electrode, a source
electrode, and a drain electrode; a gate line and a data line electrically connecting with the
gate electrode and the source electrode, respectively; and a pixel electrode electrically
connecting with the drain electrode, wherein overlapping widths between the gate
electrode and the source and drain electrodes vary in accordance with the position of the
10 thin film transistor.
